## 15.1 Double Integrals Over Rectangles

#### **Iterated Integrals**

**Fubini's Theorem** allows us to switch the order of integration. For  $a \le x \le b, c \le y \le d$ ,

$$\iint_{R} f(x,y) \, dA = \int_{a}^{b} \int_{c}^{d} f(x,y) \, dy \, dx = \int_{c}^{d} \int_{c}^{d} f(x,y) \, dx \, dy \tag{1}$$

# 15.2 Double Integrals Over General Regions

## **Integrals Between Curves**

**Type I** Region lies between two functions of x, that is

$$a \le x \le b,$$
  $g_1(x) \le y \le g_2(x)$ 

**Type II** Region lies between two functions of y, that is

$$c \le y \le d, \qquad h_1(x) \le x \le h_2(x)$$

To solve these, make sure the function bounds are in the inner integral. See textbook for images.

Area is defined as  $\iint 1 dA$ .

## Switching Order of Integration

Integrals can be switched as long as the region is the same. For example, the region defined by

$$0 < x < 4, \sqrt{x} < y < 2$$

is the same region as

$$0 \le y \le 2, 0 \le x \le y^2$$

Draw a picture!

## 15.3 Double Integrals in Polar Coordinates

$$r^2 = x^2 + y^2 \qquad x = r\cos\theta \qquad y = r\cos\theta \tag{1}$$

$$\iint\limits_{B} f(x,y) dA = \int_{\alpha}^{\beta} \int_{a}^{b} f(r\cos\theta, r\cos\theta) r dr d\theta$$
 (2)

The "infinitesimal rectangle"  $dA = dx dy = r dr d\theta$ . Don't forget the r!

## 15.4 Applications of Double Integrals

Omitted.

## 15.5 Surface Area

$$A = \iint_{D} \sqrt{f_x(x,y)^2 + f_y(x,y)^2 + 1} \, dA \tag{1}$$

Note the similarity to the arc length formula.

## 15.6 Triple Integrals

#### **Iterated Integrals**

**Fubini's Theorem** Allows us to switch the order of integration. There are different types of regions as well, defined between two functions. Make sure the functions are in the inner integrals.

# 15.7 Triple Integrals in Cylindrical Coordinates

Cylindrical Coordinates Points are given as  $(r, \theta, z)$ . r and  $\theta$  are the polar coordinates and z is the height.

$$x = r\cos\theta$$
  $y = r\sin\theta$   $z = z$  (1)

$$r^2 = x^2 + y^2 \qquad \tan \theta = \frac{y}{x} \tag{2}$$

$$\iiint_{E} f(x, y, z) dV = \int_{\theta_{1}}^{\theta_{2}} \int_{f_{1}}^{f_{2}} \int_{z_{1}}^{z_{2}} f(r \cos \theta, r \sin \theta, z) r dz dr d\theta$$
 (3)

# 15.8 Triple Integrals in Spherical Coordinates

**Spherical Coordinates** Points are given as  $(\rho, \theta, \phi)$ .  $\rho$  is the distance from the point to the origin,  $\theta$  is the same angle as in polar coordinates (xy-plane), and  $\phi$  is the angle between the positive z-axis and the line segment to the point.

Note

$$\rho \geq 0$$
 and  $0 \leq \phi \leq \pi$ 

A sphere is given as  $\rho = r$  and a cone is given as  $\phi = c$ .

#### Conversion

$$x = \rho \sin \phi \cos \theta$$
  $y = \rho \sin \phi \sin \theta$   $z = \rho \cos \phi$  (1)

Remember since  $\theta$  corresponds to polar coordinates, so x and y are just multiplied by  $\rho \sin \phi$ . See diagram in textbook.

$$\rho^2 = x^2 + y^2 + z^2 \tag{2}$$

For  $f(x, y, z) = g(\rho, \theta, \phi)$ ,

$$\iiint\limits_E f(x,y,z) \, dV = \int_{\phi_1}^{\phi_2} \int_{\theta_1}^{\theta_2} \int_{\rho_1}^{\rho_2} g(\rho,\theta,\phi) \, \rho^2 \sin\phi \, d\rho \, d\theta \, d\phi \tag{3}$$

Where  $dV = \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi$ .
